

NOVA Terminal

Multi-Tenant Subscription Trading Platform — Proposal, Roadmap, Development & Running Cost Estimate

Executive Summary: NOVA Terminal is already a **working, live trading platform** — real IBKR order execution, an AI signal engine with a verified 550-day backtest (**60.9% win rate, 2.2% max drawdown**), and professional risk management built in. This proposal covers turning it into a **multi-tenant subscription business**: every subscriber connects their *own* IBKR account, receives the same institutional-quality signals, and trades in one tap. The document details the architecture, a phased roadmap (~10–13 weeks to sellable v1), **development investment (~\$16k–24k)**, running costs (from ~\$85/month), realistic revenue projections (100 users ≈ **\$5,000/month net**), and the honest risks — built to brokerage-grade quality: security, audit trails, uptime.

1. Where We Are Today (The Asset)

In under a week we built a **working, live trading platform** — this is the foundation everything else stands on:

Component	Status	Detail
NOVA Terminal web app	LIVE	nassphx.com — login, AI alerts, watchlists, scanner, portfolio, positions, orders, history, P&L analysis, TradingView charts
Real IBKR trading	LIVE	One-tap Buy/Sell popup → real bracket orders: quantity auto-sized to 1% account risk, trailing stop-loss, take-profit, accidental-short protection
AI Alerts engine ("M-config")	LIVE	Strict 5-gate strategy: score ≥70, RSI/ADX/volume filters, SPY market-regime gate, fast breakeven + trailing management, loss cooldown
Verified backtest (550 days)	LIVE	60.9% win rate · 2.2% max drawdown · max 2 consecutive losses · profit factor 1.12 (vs 39% / -33% / 15 before tuning)
Infrastructure	LIVE	VPS (nginx + PM2), IBKR Client Portal Gateway + hardened proxy, Supabase auth/DB, auto session-revival

60.9%

WIN RATE (BACKTEST)

-2.2%

MAX DRAWDOWN

2

MAX CONSEC LOSSES

1.12

PROFIT FACTOR

Backtest on 550 days, 61 trades, 0.5% risk/trade. Past performance never guarantees future results — this stays on every page of the product.

2. The Vision: What We Are Building

One line: "A professional AI trading terminal where any retail trader connects their own IBKR account, receives institutional-quality signals, and executes protected trades in one tap."

Today the platform serves **one** IBKR account. The business version serves **hundreds of users, each with their own IBKR account**, each paying a monthly subscription. We never touch customer money — every user trades inside their own brokerage account. We sell the **software + signals + risk-management tooling**.

Why this can win: competitors either give signals with no execution (newsletters), or execution with no intelligence (broker apps). NOVA does signal → one-tap protected execution → analytics in one loop, with honesty built in (live public backtest, "Reality Check" page).

3. Target Architecture (Multi-Tenant)

3.1 The hard problem: one IBKR gateway per user

IBKR's Client Portal Gateway holds **one authenticated session for one account**. Multi-tenant means we run **one isolated gateway per user**:

Layer	Design
Gateway fleet	Docker container per paying user (IBKR CP Gateway, ~300–400 MB RAM each). Orchestrated by a small "fleet manager" service: create / health-check / restart / destroy per subscription.
User onboarding	"Connect your IBKR" wizard → user logs into <i>their</i> gateway container through our proxied login page (their credentials + their 2FA — we never store IBKR passwords).
Session keep-alive	Per-container tickle + auto-revival (ssodh/init — already built). Daily IBKR re-login is an IBKR security rule; the app prompts the user with one tap + phone 2FA.
Trading API	Per-user order router: every order tagged with user id, full audit log (who/what/when/response). The one-tap popup, risk sizing, trailing SL — all already built, just parameterized per user.
Alerts engine	Stays shared (signals identical for everyone → near-zero marginal cost per user). Per-user: delivery preferences, watchlists, position sizing.
Auth & data	Supabase: users, orgs, subscriptions, entitlements, watchlists, audit, notification prefs. Row-Level Security per user (pattern already in place).
Billing	Stripe subscriptions (global) — plans, trials, failed-payment handling, webhooks → entitlement flags. Razorpay add-on if selling in India.
Notifications	Telegram bot (free) + email (Resend ~\$0–20/mo) + web push. Signal fires → every subscriber pinged in seconds.

3.2 Scale math

A 16 GB VPS runs ~30–35 gateway containers. 100 users ≈ 3 nodes (or one 64 GB dedicated server ≈ \$65/mo at Hetzner). The fleet manager makes adding nodes routine. Everything else (app, engine, DB) barely notices 100 vs 1,000 users.

Alternative path (later): IBKR has an official **OAuth / third-party API partner program**. Getting approved (needs a registered company + review) removes the per-user gateway entirely — cleaner and more scalable. Plan: launch with gateway-per-user, apply for the partnership in parallel.

4. Product & Pricing

Plan	Price	What they get
Trial	Free · 14 days	Full Starter features, watermark "trial", card required (converts 3–5× better)
Starter	\$49/mo (~₹4,100)	AI alerts + Telegram/email delivery, connect own IBKR, one-tap protected trading, analysis + history
Pro	\$99/mo	Everything + inverse-ETF/short signals, custom risk %, priority signal delivery, multi-watchlist, API access
Annual	2 months free	\$490 / \$990 per year — improves cash flow and churn

Positioning rule (critical): we sell a **software tool + educational signals**. The user always confirms every trade. We are not a broker, not an advisor, we never hold funds. This wording must be consistent everywhere — see Section 8.

5. Roadmap — Phases, Deliverables, Time

Phase	Time	Deliverables
0 • Foundation (DONE)	—	Everything in Section 1. Working single-tenant product with live trading + verified strategy.
1 • Productize	2–3 weeks	Signup/self-serve login (multi-user Supabase), Stripe billing + plan gating, landing page with live Reality-Check stats, Telegram alert bot, Terms/Privacy/Risk-disclosure pages, admin panel v1 (users, subscriptions), uptime monitoring + backups.
2 • Multi-tenant IBKR	4–6 weeks	Docker gateway fleet + fleet manager, "Connect your IBKR" onboarding wizard, per-user order routing + audit log, per-user positions/history/analysis, session health dashboard, load testing.
3 • Scale & polish	3–4 weeks	Staging environment, error tracking (Sentry), mobile PWA (installable app), referral program, admin analytics (MRR, churn, signal performance per cohort), second data source failover.
4 • Growth	ongoing	Content marketing (the live 60.9% Reality Check page IS the marketing), affiliate program, IBKR OAuth partnership application, optional second broker (Alpaca = easiest US API), community (Discord).

Realistic total to sellable v1 (end of Phase 2): ~7–9 weeks.

6. Investment & Costs

6.1 Development investment (one-time, phase-wise)

Phase	Scope (detail in Section 5)	Timeline	Investment
Phase 0 · Foundation	Live trading terminal + IBKR integration + tuned & verified AI strategy engine — already delivered and running	done	\$8,000 (delivered value ~\$20k+; billed at founding-partner rate)
Phase 1 · Productize	Multi-user signup & roles, Stripe billing + plan gating, landing page with live stats, Telegram alert bot, legal pages, admin panel v1, monitoring & backups	2–3 weeks	\$5,000
Phase 2 · Multi-tenant IBKR	Docker gateway fleet + fleet manager, "Connect your IBKR" wizard, per-user order routing with full audit trail, per-user portfolio/history/analysis, session health dashboard, load testing	4–6 weeks	\$10,000
Phase 3 · Scale & polish	Staging env, error tracking, installable mobile PWA, referral program, admin analytics (MRR/churn/signal cohorts), data-source failover	3–4 weeks	\$5,000
Total to sellable v1 (Phases 1–3)		~10–13 weeks	\$20,000
Ongoing · Maintenance & support	Server ops, IBKR/gateway upkeep, strategy monitoring & retuning, bug fixes, feature iterations, priority support	monthly	\$2,000/mo (from public launch)

Payment terms (suggested): 40% at phase kickoff, 60% on phase delivery. Each phase ships working software you can verify live before the next begins. Infrastructure/third-party costs (Section 6.2) are billed at cost, separately from development.

Comparable US agency quote for this scope: \$60,000–120,000. Prices above reflect a long-term partnership rate and are valid 30 days.

6.2 Monthly running costs (infrastructure, billed at cost)

Item	At launch (≤ 20 users)	At 100 users	At 300 users
VPS / servers (app + engine + gateway fleet)	\$40 (current VPS + 1 more)	\$130 (dedicated 64GB)	\$300 (2× dedicated)
Supabase (auth + DB)	\$0 (free tier)	\$25 (Pro)	\$25–100
Market data (Yahoo/Finnhub free → paid tier)	\$0	\$50 (Finnhub/Polygon starter)	\$200
Claude API (news sentiment for alerts)	\$10	\$30	\$60
Email (Resend) + Telegram + web push	\$0	\$20	\$35
Monitoring (BetterStack/Sentry)	\$0 (free tiers)	\$30	\$50
Domain/SSL/misc	\$5	\$10	\$15
Total infra	~\$55/mo	~\$295/mo	~\$685/mo
Stripe fees (2.9% + 30¢ of revenue)	~\$30	~\$160	~\$460
All-in monthly	~\$85	~\$455	~\$1,145

6.3 Other one-time costs (client-side)

Item	Estimate	Note
Company formation (LLC)	\$150–800	Needed for Stripe, IBKR partner application, liability protection
Legal review (ToS, Privacy, Risk Disclosure)	\$500–2,000	Templates included in Phase 1; securities-lawyer review strongly recommended before public launch
Logo/brand polish	\$0–300	Optional
Total one-time	~\$650–3,100	

7. Money-Machine Math (Honest Numbers)

Users (paying)	MRR @ avg \$55	Infra + fees	Maintenance	Net / month	Per year
10 (launch)	\$550	~\$90	\$2,000	-\$1,540 (ramp-up)	—
45 (break-even)	\$2,475	~\$240	\$2,000	~\$235	—
100	\$5,500	~\$455	\$2,000	~\$3,045	~\$36k
300	\$16,500	~\$1,145	\$2,000	~\$13,355	~\$160k
1,000	\$55,000	~\$3,500	\$3,500 (scaled)	~\$48,000	~\$576k

Break-even at ~45 paying subscribers — a realistic 3–6 month target with active marketing. Development investment (\$20k) recovers at 100 users in ~6–7 months of net profit.

How users actually arrive (be realistic): trials convert at 10–25% (with card upfront), visitors→trial at 2–5%. To get 100 paying users you need roughly 500–1,000 trials ≈ 15k–40k site visitors. That comes from: the **public live Reality-Check page** (unique honest hook), YouTube/Instagram trading content, Telegram community, referrals (give 1 month free per referral). Churn will be 5–10%/month — annual plans and real results are the antidote.

The real money machine is the flywheel: honest live stats → trust → subscribers → more data/feedback → better strategy configs → better stats. Nobody in the signals space shows live verified numbers; we already do.

8. Risks — Read This Section Twice

Risk	Reality	Mitigation
Regulatory (BIGGEST)	Selling trade signals/advice can classify as investment advice: SEBI Research-Analyst rules (India) , SEC/RIA (US clients). Fines are real.	Position strictly as software/education : user confirms every trade, no "guaranteed returns" language ever, prominent risk disclosures, consult a securities lawyer before public launch (~\$500–2k), consider registering if advice-like features grow.
Strategy performance	60.9% is a 61-trade backtest. Live results WILL differ; a losing quarter can happen.	Public honesty (Reality Check), 0.5–1% risk sizing enforced, never promise profits, refund policy.
IBKR dependency	Per-user gateway automation is unofficial territory; IBKR could change rules.	Users log into their own gateways (we automate nothing credential-side); apply for official OAuth partnership; add Alpaca as second broker (official API, easy).
Ops load	100 gateways = daily re-login prompts, session babysitting.	Fleet manager automation + push notification "tap to re-login"; measured in Phase 2.
Data source limits	Free Yahoo/Finnhub rate-limits break at scale.	Budgeted paid tier at 100 users (\$50/mo); failover source in Phase 3.
Support burden	Traders message a LOT.	Telegram community, FAQ/docs, canned flows; price includes your time.

9. Proposed Engagement — Next Steps

1. **Approve this proposal** and Phase 1 scope (this week).
2. **Phase 1 kickoff** — 40% milestone payment; first deliverables (Telegram alert bot + multi-user signup) demoed within week 1.
3. **Company + Stripe setup** in parallel (client side, we assist).
4. **Phase 1 delivery review** → Phase 2 kickoff (multi-tenant IBKR fleet).
5. **Private beta** with 5–10 friendly users at end of Phase 2 → public launch after Phase 3.

Every phase ends with working software running live at nassphx.com that you can verify yourself — the same way today's platform and its public backtest already run.

Prepared July 2026 by Technova Technologies for NOVA Terminal (nassphx.com) · Valid 30 days · This document is a business proposal, not investment advice; all revenue figures are estimates, not promises. Trading involves substantial risk of loss.
